

Employee Information Management System(EIMS) Flow Chart

Figure 1: Login flow

The authentication process begins on the login screen, where the user submits their registered email address and password. The backend API then validates these credentials against existing records. If the credentials are invalid, the system returns an "Error 401 Unauthorized" response and loops the user back to re-enter their login details.

Upon successful credential validation, the system initiates two-factor authentication by generating a 6-digit One-Time Password (OTP) for the user. Once the user inputs this OTP, the backend verifies both the code's accuracy and whether it was submitted within the 5-minute expiration window. If the OTP is incorrect or expired, an "Invalid or Expiration OTP" error is returned, redirecting the user back to the OTP input step. Once a valid OTP is confirmed, the system issues a JWT session token, marks the user as successfully authenticated, and redirects them to the dashboard with an active session.

Figure 2: Employee Onboarding Flow

The employee onboarding process begins when onboarding is initiated, prompting the HR Admin to fill out the Employee Information Form and save the record. Once saved, the System automatically sets the employee's status to "Pending" and sends an alert to the IT Admin.

Upon receiving the notification, the IT Admin opens the employee profile, provisions the necessary credentials, and saves the updates. This action triggers the System to finalize the record and notify HR that the setup is complete, concluding the workflow with the employee marked as "Ready for work."

Figure 3: Archiving Employee Flow

The employee archival process begins when an archive request is initiated, prompting the HR Admin to click "Deactivate & Send Archive Request" and input the employee's separation date and reason. Once submitted, the System updates the record to "Status: Deactivation Initiated" and sends an alert to the IT Department.

Upon receiving the alert, the IT Admin begins the clearance process, which involves clearing user accounts, revoking access keys, and collecting company hardware. If clearance tasks remain incomplete, the IT Admin continues working through the checklist; once complete, the System sets the status to "Ready for Archive" and notifies HR.

To conclude the workflow, the HR Admin clicks the finalize button to execute final archival processing. The System then updates the record to "Archived Soft-Deleted from Active Directory," marking the archive process as complete.
